The background of the slide is an aerial photograph of a Swedish archipelago. It shows a vast expanse of blue water with numerous small, green islands and peninsulas. The foreground is dominated by a dense forest of green trees, with a winding path or road visible on the left side. The sky is a clear, light blue with a few wispy clouds.

The siting process for a  
deep repository for spent  
nuclear fuel in Sweden

Saida Laârouchi Engström

Idaho Falls 28 August 2023

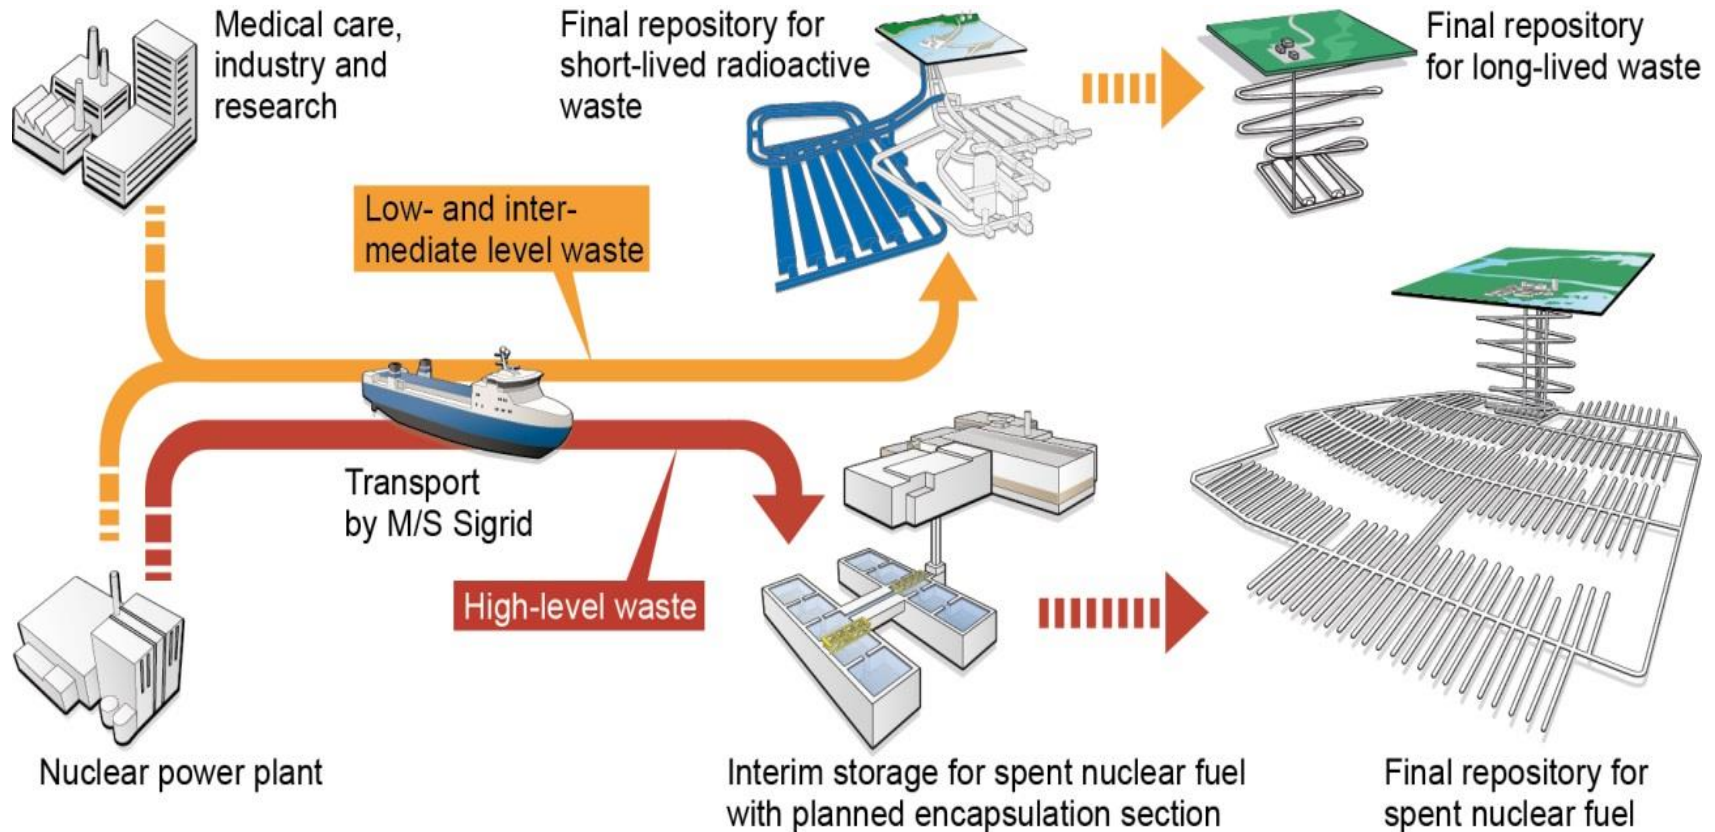

# Starting points

- Nuclear power activities started in the 1960ies. Early plans for 24 reactors
- 12 reactor units at 4 sites started between 1972 and 1985. 50% of electricity
- Nuclear power under critical discussion since mid-1970s
- Referendum on nuclear power in 1980
- Slow face-out in progress. 6 reactors after 2020
- Waste high on the agenda for the last 40 years

- Early plans, reprocessing abroad, no waste return, LLW to be sea dumped

# The Swedish back-end system

Basic principles and general direction decided early (mid-70s)

Implementation as needed

Ongoing licensing: Deep geological repository for spent fuel at Forsmark

Encapsulation plant at Oskarshamn

Extension of short-lived repository for decom. waste at Forsmark

# Clear responsibility and financing

## SKB's owners:

**Sydkraft  
Nuclear Power  
AB**

## Financing:

About 0.04 SEK per kWh of nuclear electricity

Around 80 billion SEK in 2021

**Available funding key to conduct planned programme**

- To safely handle, store and dispose of all spent fuel and radioactive waste from the Swedish nuclear power plants
- To develop, build and operate all facilities and systems needed for the safe management of all wastes
- To perform the necessary research and development to show the feasibility of the technology applied and the short and long term safety of the facilities
- To perform the siting activities for the facilities and the corresponding information activities
- To develop a long term planning for all activities and calculate the corresponding costs (every three years)
- SKB is thus fulfilling the legal responsibilities of the NPP owners.
- SKB is also disposing waste from other activities in Sweden, e.g. hospitals and research, on contract.

# Final Repository for Short-lived Radioactive Waste, SFR

**Early repository design – possible to optimize system**

# Sea based transport system

# Central Interim Storage Facility for Spent Nuclear Fuel, Clab

Interim storage provides flexibility

# The KBS-3 method for disposal of spent nuclear fuel

**Primary safety function: Total containment**  
**Secondary safety function: Retardation**

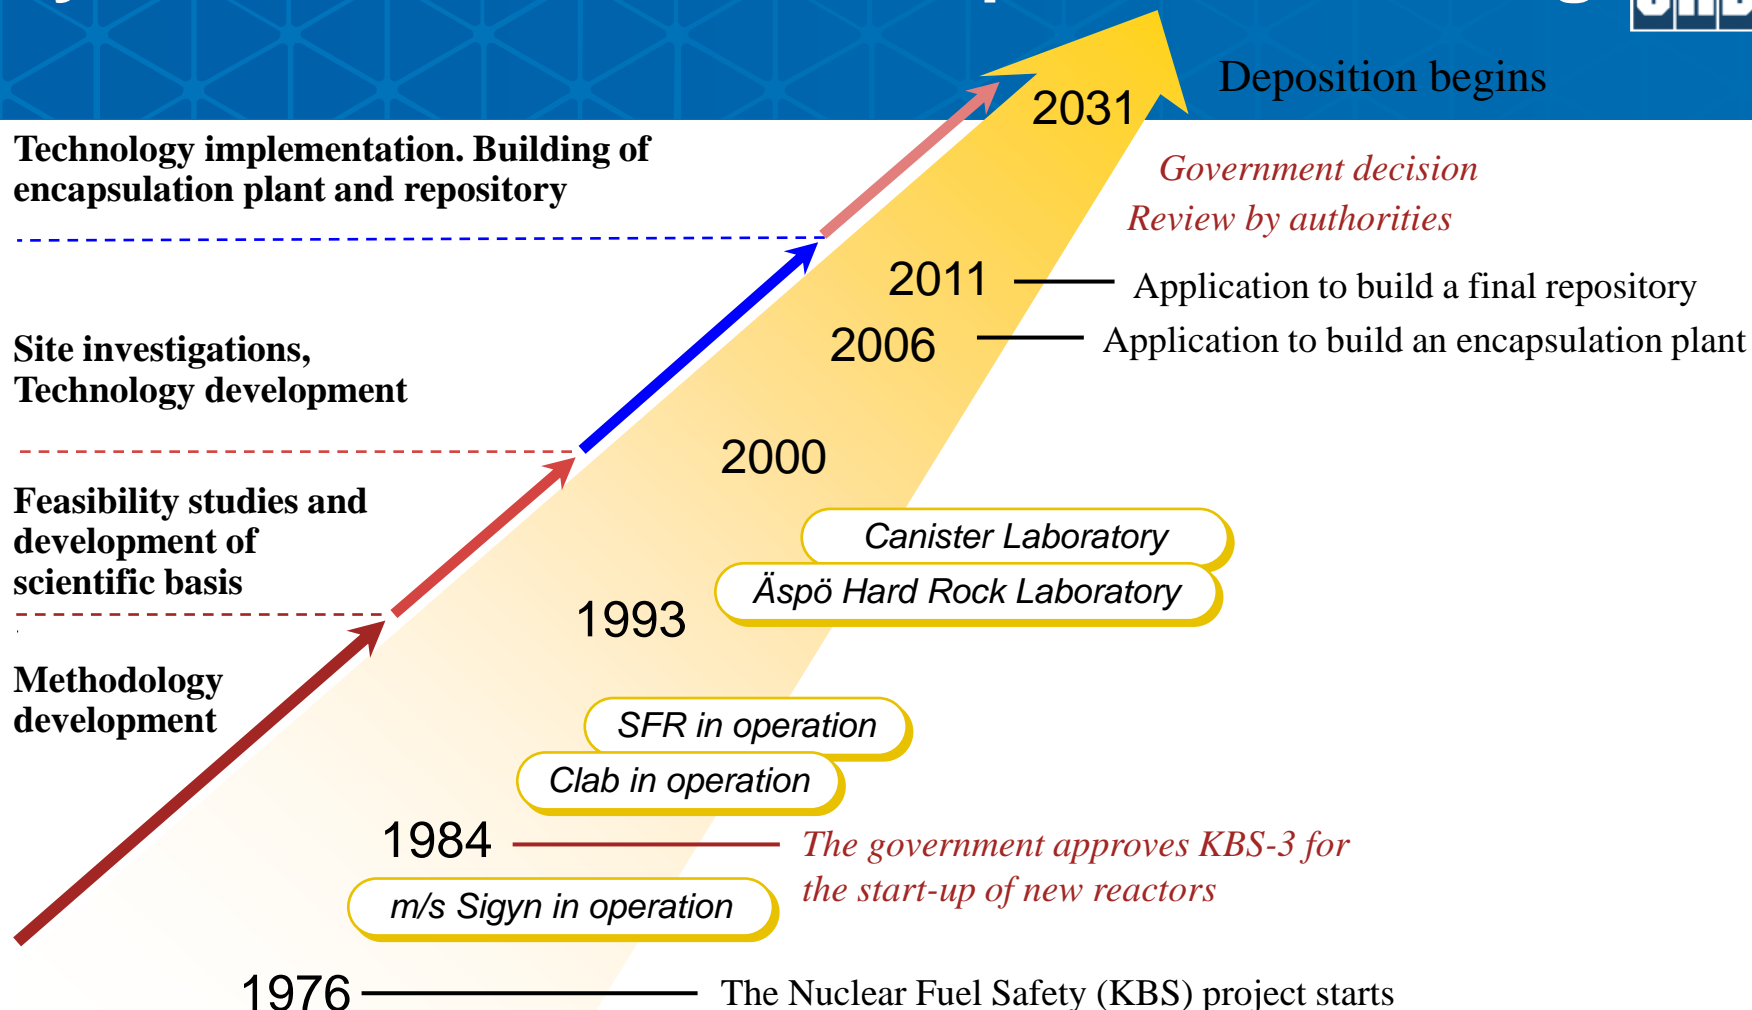

# The planned Spent Fuel Repository at Forsmark

# Encapsulation plant will be connected to the Clab facility

# 40 years of research, development and siting

**Development and siting of repository takes time.  
Includes important RD&D.**

# RD&D programmes basis for Government decisions on future development

RD&D 2016

RD&D 2013

RD&D 2010

RD&D 2007

RD&D 2004

RD&D 2001

RD&D 1998

RD&D 1995

RD&D 1992

R&D 1989

R&D 1986

R&D 1984

**Recurrent RD&D programmes provides a chance to adapt to experiences and to communicate with stakeholders.**

# SKB laboratories essential for improved scientific understanding and technical development

Canister laboratory, in operation since 1998

Äspö Hard Rock Laboratory, in operation since 1996

Bentonite laboratory, in operation since 2007

# Siting of a repository for spent nuclear fuel

Knowledge accumulation

Study sites  
1977-1985

General siting studies  
1997-1999

Siting process

- Hultsfred
- Malå
- Nyköping
- Oskarshamn
- Storuman
- Tierp
- Älvkarleby
- Östhammar

Feasibility studies  
1992-2000

- Oskarshamn (Laxemar)
- Östhammar (Forsmark)

Site investigations  
2002-2007

Decision on site  
2009

Licensing  
ca. 2011-2022

Construction  
ca. 2023-2030

**Understanding the geology first step in implementation**  
**Siting a controversial facility → Hosting a requested facility**

# Important components in building trust

- Your project has to be explained in an understandable way to the public
- Understand all dimensions of your project; scientific, social, political and ethical
- Openness on challenges and potential impacts
- Open ears to local concerns and views, even critical ones

## Desired result

- Turn a national challenge into a local interest to contribute
- Keep a positive attitude

**Trust and safety are key factors for success**

# Key factors for success

- Define the responsibilities and rights of the waste producers and explain the role allocated to each stakeholder (the way one organises the nuclear waste management is key)
- Be sure to define clear responsibilities for implementation and financing
- Understand the importance of a trustworthy regulator being present in the siting process
- Define your siting process in advance
- Get the public involved early in developing that process and gain their trust by taking into account their relevant expectations
- Make sure your Scientific/engineering approach is stepwise, adaptive and iterative
- Be open about the challenges as well as the advantages of the project in your dialog with all stakeholders under the siting process
- Use your best experts with communicative skills
- Expect opposition
- Acquire patience, building trust takes time

The background is a scenic photograph of a rocky coastline. In the foreground, large, dark, textured boulders are scattered across the shore. The water is a deep blue, with white foam from waves crashing against the rocks. In the distance, a line of trees and a small island are visible under a clear, bright blue sky.

Thank you for your  
attention!
